Learning through research: a Serbian tradition

Srdjan Verbic tells the story of the Petnica Science Center, which brings enthusiastic students (and teachers) from across Europe to a village in Serbia, where together they discover the joy and fascination of science.

There is one outcome of teenage research projects that is often undeservedly overlooked. Research not only allows self-directed learning, the fostering of critical thinking skills and thinking outside the ‘classroom science’ box, but also enables young people to gain very important social skills: communication, teamwork and listening to one another’s ideas.

We all enjoy spending time in dynamic, stimulating surroundings and teenagers are no different. It is not easy being a teenage scientist these days, and it is particularly hard in the Balkans. Difficult times, lack of materials and the unpopularity of science amongst school friends prevent those interested in science from taking it further. This is where centres of excellence come in - attracting and motivating young people to take on a collaborative research project outside the standard school curriculum.

Unfortunately, a great majority of them did not have the ‘critical mass’ to maintain their operation. However, one centre, established in former Yugoslavia (now in Serbia), has survived, developing its programmes and attracting more visitors each year. Twenty-five years ago, in a village called Petnica, 100 kilometres southeast of Belgrade, an unusual science education centre was founded and soon became a hideaway for many rebellious secondary-school and university students from all over Yugoslavia. The attractive landscape and rich natural resources, such as a canyon, caves and archaeological sites, caught these students’ attention. Even though they were deeply unsatisfied with the formal education system, they were truly enthusiastic.
about nature and scientific work, and realised there was much more to education than school. Long before Petnica was formally established, some camps were organised for students of Belgrade University and members of a movement called Young Researchers of Serbia. Eventually, they managed to find government support to start an organisation with a few employees, a pile of books and a couple of Spectrum computers. Thanks to their efforts, an extracurricular educational centre was established for future generations of curious minds.

Since its beginning in 1982, Petnica Science Center has organised nearly 2300 programmes (seminars, workshops, camps and small conferences) for more than 40,000 secondary-school pupils, university students and teachers interested in science and technology. Today, Petnica is the largest independent, non-profit organisation for out-of-school science education in south-eastern Europe.

Programmes at Petnica help students to focus on the scientific method and to write science reports and papers. In this way they are ‘learning through research’.

Examples of students’ projects

The following oral presentations were given at the Petnica Students’ Science Conference 2006:

- Influence of ultrasound on the electrochemical production of hydrogen on different electrodes (Chemistry)
- Simulation of chaos in an RLD circuit (Electronics)
- Boosted SMRNN: online speech recognition (Computer Science)
- Types of children’s names for typical and atypical concepts (Linguistics)
- Determination of an open cluster age (Astronomy)
- The position of pronominal enclitics in constructions with infinitive (Linguistics)
- Influence of World War II on given names in the Savski Venac municipality (History)
- Numerical simulation of one-dimensional freely evolving granular gas (Physics)
- Relationship between school success, popularity, and status of ‘crammer’ in a group (Psychology)
- Archaeological-historical interpretation of the Vojlovica monastery (Archaeology)
- Relationship between physical characteristics of abstract visual stimuli and their connotative meanings (Psychology)
- New aspects of applying acid-base titrations for ascorbic acid determination (Chemistry)

Participants ‘discover’ various facts, relationships, structures or models for themselves, under the supervision of experienced researchers. School curricula cannot keep up with the growth of current scientific knowledge so researchers concentrate on developing a few specific skills: how to observe and access information, evaluate content and credibility and infer consequences and possible meanings.

Petnica Science Center has 15 science and technology programmes (including subjects such as archaeology and astronomy) which consist of a series of seminars. The first seminar (in winter, lasting 7 days) is a chance for students to see Petnica from inside and realise that some school subjects can be learned in unexpected ways. The second seminar (spring, 4-8 days) is dedicated to methodology of research, and concentrates on practical things like measuring, using instruments, drawing graphs and writing short reports. Students then propose a research plan for the summer seminar.
Attending the Petnica International Science School

The Petnica International Science School gathers gifted students, unusually motivated for learning through research, from all over the world. The next science school will be in August 2008 and all students aged 17-20 are eligible to apply. Application forms and instructions are available on the Petnica website[1]. The programme fee is €500, but financial support is always available for students from south-eastern Europe.

Background

The Petnica International Science School gathers gifted students, unusually motivated for learning through research, from all over the world. The next science school will be in August 2008 and all students aged 17-20 are eligible to apply. Application forms and instructions are available on the Petnica website[1]. The programme fee is €500, but financial support is always available for students from south-eastern Europe.
Serbian, but all have summaries in English. Of course, guest participants from other countries present their work in English.

After 2000 programmes had been run in Serbian, Petnica finally started an international science school which is run in English and open to secondary-school students both within and outside Serbia (see box on page 35). The fact that international students cannot visit Petnica as frequently makes the programme concept quite different. There is no time for endless corrections of research plans, reports and final presentations. Everything should be finished in just two weeks. The basic idea behind such a school is to increase students’ interest in scientific research and to give them the opportunity to practice scientific methodology. In the first two years, students (aged 17-20) from 12 countries attended this programme. In spite of the distance from their home countries, some of them have already started to come back. The third international school will end before this article goes to press. The fourth will be in August 2008.

Although it might seem that a centre like Petnica needs great human and material resources for all these programmes, it doesn’t really require anything more than the proximity to an average-sized university town. There is no need for ‘space-age’ equipment because in order to learn through research it is more important to have stimulating surroundings, a decent library, computing facilities, a few small laboratories where students can work whenever they want and, of course, a group of enthusiastic people willing to share and discuss their interests and ideas. The main problem is trying to encourage people (such as scientists, teachers, officials and sponsors) to participate in an independent project that promotes critical thinking and a passion for science in young people – things that you cannot easily commercialise.

Petnica is particularly proud of the way everyone is frequently encouraged to share ideas, demonstrate new concepts and ‘teach’ younger colleagues. There are programmes for primary-school students, in which the bright instructors are only a few years older than the pupils. Programmes with secondary-school students are enhanced by the participation of university students. All students are...
encouraged to ask questions and discuss science with others, whatever their age. There are no teachers and students because everyone learns from each other. We only have more or less experienced researchers.

The centre may have been designed for students, but Petnica is well-known for its specialised courses and workshops for schoolteachers. The centre carries out teacher training for hundreds of science, technology and humanities teachers every year in the same exciting style and by making use of the stimulating environment, which then indirectly influences tens of thousands of students. For teachers, Petnica is a meeting place, a club with a positive atmosphere where their opinion really matters.

Inadequate science education and unenthusiastic public attitudes toward science and technology seem to be problematic all over the world, not just in Serbia. However in developing countries these issues are more prominent because of such effects as the brain drain, limited accessibility of major scientific centres, and old-fashioned equipment and didactic teaching methods. Fortunately, there are some small centres of excellence, such as Petnica, which continue to work hard to break down these barriers preventing the development of budding scientists.

Cecilia (a 17-year-old from Sweden) sent this message after attending Petnica in 2005: “Today I finally managed to do something more than sleeping, eating, looking at photos, and telling my family about how fantastic you [Petnica] are and how much I want to go back (I think they’re quite tired of hearing about you by now...). So, instead I wanted to see some friends and showed them photos and told THEM how fantastic you are and how much I want to go back...”

Contact
For all comments, ideas or questions, or if you want to set up a similar centre in your country, you can contact the staff of the Petnica Science Center by post (Petnica Science Center, P.O. Box 6, 14104 Valjevo, Serbia) or email (pi@psc.ac.yu).

dents and enthusiastic teachers.
BACKGROUND

As I visited other parts of Serbia, I was struck by how well known and well-visited Petnica is. Every (English-speaking) person I met had heard of Petnica and many of them had attended one or more programmes. One consequence of Petnica’s 25-year history is not only that everybody has heard of Petnica, but that Petnica alumni are to be found in almost every university, company and other organisation in Serbia.

I was impressed by how Petnica enables young people to learn for themselves how exciting science is – whatever their future careers will be. ‘Science’ is interpreted widely, with the emphasis on enquiry rather than topic. Programmes not only cover standard scientific subjects like biology, physics and astronomy, but also psychology, linguistics and social science. The young people are encouraged to come back year after year, attending programmes in varied subjects: physics followed by social history, or geology by psychology. Those who have attended several programmes are free to visit Petnica at other times, perhaps to help teach younger students or to use the facilities for university research projects.

One important aspect of Petnica is that – with the exception of the final conference – it is not competitive: there are no prizes or certificates. Nonetheless, students can use the results of their research project or their conference paper to demonstrate their experience when applying to university. Another benefit is that the young people attending the programmes have direct and prolonged contact with scientists at different stages of their career (including university undergraduate students, PhD students, young scientists and professors). This gives them a good opportunity to find out about science careers.

The young people I met were definitely not the stereotypical overly-focused scientists: they were open and friendly, with wide-ranging interests. Whether they become scientists or take their enthusiasm and scientific experience into other fields, they will be a valuable resource for Serbia.

While I was impressed by the beautiful surroundings and large airy buildings, my most striking memory of Petnica is of the atmosphere of excitement and enthusiasm. I wish something similar had been available when I was at school and university in the UK.

An outside viewpoint

Just before Science in School went to press, the editor, Eleanor Hayes, visited Petnica.

One important aspect of Petnica is that – with the exception of the final conference – it is not competitive: there are no prizes or certificates. Nonetheless, students can use the results of their research project or their conference paper to demonstrate their experience when applying to university.
